IS212 (AY 2026/27 T1) – Week 7 Customer Changes

Week 7 Customer Update

ConnectSphere has continued to review its event-planning and venue-booking requirements as development progresses. The table below summarises the suggested customer changes for Release 1. All of the suggested changes should be implemented in your submission. The customer does not anticipate any further changes for Release 1.

Suggested Changes

#	Suggested Change	What Changes
1	Venue Setup and Turnaround Time	ConnectSphere has found that simply checking an event's advertised start and end time is not sufficient when determining whether a venue is available. Venue Staff need time before each event to prepare the room and additional time afterwards to reset the venue for its next use. Each venue must therefore have a configurable **setup time** and **turnaround time**, and these periods must be included when checking availability and detecting booking conflicts. For example, an event scheduled from 10:00am to 12:00pm with 30 minutes of setup and 45 minutes of turnaround effectively occupies the venue from 9:30am to 12:45pm. Existing bookings that become problematic under the new rule should be identified rather than silently removed.
2	Venue Becomes Unavailable After Booking	ConnectSphere needs Venue Staff to be able to mark a venue temporarily unavailable because of maintenance, equipment failure, renovation, safety concerns, or other operational reasons. This may occur even when future events have already been booked at the venue. When this happens, the existing event itself should not automatically be cancelled. Instead, affected bookings should be identified and the relevant Event Coordinators informed that alternative arrangements are required. The system should preserve the original event information while allowing the coordinator to search for and request a replacement venue.
3	Multiple Venues for One Event	ConnectSphere has begun supporting larger events that use several spaces at the same time. For example, a conference may require one auditorium for the main programme and three smaller rooms for breakout sessions. The system must therefore allow a single event to have more than one venue booking. Each venue should be checked independently for suitability, availability, and conflicts, while still remaining associated with the same event. Changes or cancellation of one venue arrangement should not automatically remove the other venue bookings unless this is explicitly required.

#	Suggested Change	What Changes
4	Tentative Venue Holds Expire	Venue Staff have explained that they sometimes temporarily hold a venue while an Event Coordinator is finalising event arrangements. These tentative holds should not reserve a venue indefinitely. Each hold must therefore have an expiry date/time. If the required action is not completed before the deadline, the hold should expire and the venue should become available for other requests. The Event Coordinator should be informed before or when the hold expires, and an expired hold should not be treated as a confirmed booking.
5	Addition of Event Coordinator Lead Role	ConnectSphere has introduced a new internal role, the **Event Coordinator Lead**, who is responsible for overseeing incoming event requests and assigning them to individual Event Coordinators. Newly submitted event requests should no longer be assigned directly to an Event Coordinator. Instead, they first enter an **unassigned queue** that can be viewed by the Event Coordinator Lead. The Lead can review basic event information, assign a suitable Event Coordinator, and reassign events where necessary. Event Coordinators should only be able to manage events assigned to them, while the Event Coordinator Lead should be able to view all coordinator assignments and active events under their supervision. Relevant users should be notified when assignments or reassignments occur.
6	Operational Feasibility Check	ConnectSphere has introduced a new internal role, the **Safety Officer**, who is responsible for reviewing the operational safety of planned events. After the venue and technical arrangements have been confirmed, the Safety Officer must conduct an **Operational Safety Check** before the event can proceed to preparation. The review considers factors such as expected attendance, venue capacity and layout, emergency access, accessibility requirements, equipment placement, crowd movement, and any known venue restrictions. The Safety Officer may **approve the event, reject the safety arrangement, or request changes**. If changes are required, the event returns to the relevant earlier planning stage and affected venue or technical arrangements may need to be reviewed again. The event cannot proceed to preparation until the Safety Officer has approved it. You can assume that the Safety Officer will always give a response (approve/reject/request).
